

# How it works:

## Emergency Response Team on Board:

The airship can carry a highly trained medical and rescue team, equipped with medical tools and supplies for immediate care.

## Rapid Access to Remote Areas:

Its capacity to operate in difficult terrain allows it to quickly reach affected areas where other vehicles may have difficulty accessing.

## Treatment and Transport:

The team on board can provide initial treatment and medical care while the airship transports patients to the nearest hospital or treatment center, reducing waiting times and increasing chances of survival.

## Airborne ICUs

can be equipped as hospitals and provide care directly on site.
