

DETAILED STRUCTURE WEIGHT AND PERFORMANCE CALCULATION FOR ETERNAUS – “EXPLORER H2”

$\varnothing_{\text{máx}} =$	16,9 m (D)
C=	100 m (L)
Relação L/D=	5,917
$V_{\text{real}}/V_{\text{cil}}=$	0,694
$S_{\text{real}}/S_{\text{cil}}=$	0,746
$S_{\text{trans. máx}}=$	224,3 m ²
$S_{\text{ext}}= 5.757 \times 0,746$	4.295 m ²
$V_d= 22.400 \times 0,694$	15.567 m ³
$E_{\text{máx}}=$	20.230 Kg

Aerodynamics & friction loss (velocity)

$$W = C_w \cdot F \cdot \sigma / 2 \cdot \text{vel}^2$$

$$W = C_w v^{2/3} \times V^{2/3} \times \sigma / 2 \times \text{vel}^2$$

l/d = Length of the body/biggest body diameter

$$C_w v^{2/3} \text{real} = 0,017834$$

$$\sigma = 0,1275$$

F= Spantquerschnitt

(V = volume of the Airship)

(slender-slim factor)

(Hindenburg_Dubbel pg 271)

(Dubbel pg 246)

$$W = 0,017834 \times (15.567)^{2/3} \times 0,1275/2 \times \text{vel}^2$$

$$W = 0,017834 \times 623,45 \times 0,1275 / 2 \times \text{vel}^2$$

$$W = 0,71279 \times \text{vel}^2 = \text{força em kg}$$

$$\text{Pot}_{\text{real}} = W \times \text{vel} / 75 = 0,71279 \times \text{vel}^3 / 75 = 0,009504 \times \text{vel}^3$$

0,009504.vel³ = Displacement factor for Explorer

If we would consider the aerodynamic penetration formula (used for cars, planes etc.):

$$W = C_w \times F \times \sqrt[3]{2g} \times \text{vel}^2$$

$$C_w = 0,35 \text{ e } F = 224,3 \text{ m}^2 = S_{\text{transv. Max}}$$

Edifício “IMPERIAL BERRINI OFFICES”

Rua Alcides Ricardini Neves , 12 Cj 111 – Cep 04575-050 – Brooklin Novo – São Paulo – SP-
Fone (011) 5505-9522 – Fax (011) 5505-9531

$$W = 0,35 \times 224,3 \times 1/16 \times \text{vel}^2$$

$$W = 4,907 \cdot \text{vel}^2 = (\text{Kg})$$

$$\text{Pot} = W \times \text{vel}/75 = 4,907 \times \text{vel}^3/75 = 0,06543 \cdot v^3$$

$0,06543 \cdot v^3 = \text{displacement factor if using aerodynamic penetration formula}$

$$0,06543 / 0,009504 = 6,884 \text{ times bigger}$$

$$\text{PS} = 0,009504 \times \text{vel}^3$$

$$\text{At velocities of: } 50 \text{ km/h} = 13,88 \text{ m/s} \quad \text{PS}=25 \text{ CV}$$

$$\text{At velocities of: } 70 \text{ km/h} = 19,44 \text{ m/s} \quad \text{PS}=70 \text{ CV}$$

$$\text{At velocities of: } 100 \text{ km/h} = 27,77 \text{ m/s} \quad \text{PS}=203 \text{ CV}$$

$$\text{At velocities of: } 140 \text{ km/h} = 38,88 \text{ m/s} \quad \text{PS}=560 \text{ CV}$$

$$\text{At velocities of: } 210 \text{ km/h} = 58,33 \text{ m/s} \quad \text{PS}=1886 \text{ CV}$$

For the maximum velocity of 210 km/h, required power of 1886 CV

$$\text{Pot} = W/75 \cdot v^3$$

$$W = 1.886 \times 75 / 58,33 = 2.425 \text{ kg}$$

Determination of the structural central tube for a turbine force of 2.425 kg

For an internal pressure of 2,0 kg / cm², required transversal surface = 1.212 cm²

$$S = \Pi \times \varnothing^2 / 4$$

$$\varnothing = (S \times 4 / \Pi)^{1/2}$$

$$\varnothing = (1.212 \times 4 / 3,1416)^{1/2} = 39 \text{ cm} \approx 400 \text{ mm}$$

$$40 \times 2 \text{ kg/cm}^2 = 80 \text{ kg} \quad 40 \text{ kg in } 1 \text{ cm} = 4,0 \text{ kg/mm}$$

$$\text{With a } 0,4 \text{ mm aluminum sheet we will have } 4,0/0,4 = 10 \text{ kg/mm}^2$$

Determination of the cave rings

$$(\frac{1}{2} \text{ of the } \varnothing \text{ of central tube}) \quad \varnothing = 200 \text{ mm (20 cm)}$$

$$20 \times 2 \text{ kg/cm}^2 = 40 \text{ kg} \quad 20 \text{ kg in } 1 \text{ cm} = 2,0 \text{ kg/mm}$$

$$\text{With a } \mathbf{0,2 \text{ mm}}$$
 aluminum sheet we will have 10 kg/mm²

Edifício "IMPERIAL BERRINI OFFICES"

Rua Alcides Ricardini Neves , 12 Cj 111 – Cep 04575-050 – Brooklin Novo – São Paulo – SP- Fone (011) 5505-9522 – Fax (011) 5505-9531

Determination of the external cover

$A_L = 0,4\text{mm}$ duralumin (ALLOY 2090-T83 SHEET density $2,6 \text{ kg/dm}^3$)

Density = $2,6 \text{ kg/dm}^3 = 2,6 \text{ kg /m}^2 \text{ /mm}$

Superficial density = $2,6 \times 0,4\text{mm} \text{ kg/m}^2 = 1,04 \text{ kg/m}^2$

Sigma rupture al.= 83 kg/mm^2

Resist = 65 kg/mm

Sigma solicitante = $3,55 \text{ kg/mm}$ or 420 mmCA

S_{ext} (external surface) = $4.295 \text{ m}^2 \times 1,04 = \mathbf{4.470 \text{ kg}}$ total weight

Weight of the central tube

$S_{\text{ext tubo central}} = (0,4 \times \pi \times 100 \approx 126 \text{ m}^2) \times 1,04 \text{ kg/m}^2 = \mathbf{131 \text{ kg}}$

Weight of the circular caves

$\varnothing = 200$ 7x caves $\varnothing_m = 15\text{m}$

$W_{\text{Caves}} = 30 \text{ m}^2 \times 7 = 210 \text{ m}^2 \times 0,52 = \mathbf{150 \text{ kg}}$

$W_{\text{Spectra cables (3mm)}} = 4,2 \text{ g/m} \approx 11.500 \text{ m} \times 4,2 \approx \mathbf{50 \text{ kg}}$

$W_{\text{of the 8 PE balloons}} = 6.087 \text{ m}^2 \approx \mathbf{608 \text{ kg}}$

$W_{\text{Preliminar structure}} = 4.470 + 131 + 150 + 50 + 608 \approx \mathbf{5.410 \text{ kg}}$

Weight of the hydrogen:

Volume = $15.567 \text{ m}^3 \times 0,1 \text{ kg/m}^3 = 1.557 \text{ kg} + (5\% \text{ overpressure } 420 \text{ mmca})$

Weight of Hydrogen = $\mathbf{1.634 \text{ kg}}$

Aluminum profiles $0,3 \text{ kg/m}$ $\varnothing \text{ medium} = 10\text{m}$ $P = 30\text{m}$

$W = 12 \text{ kg/rings} \times 40 = \mathbf{480 \text{ kg}}$

Weight Total (sum) = $5.410\text{kg} + 1.634 \text{ kg} + 480 \text{ kg} \approx \mathbf{7.525 \text{ kg}}$

$E_{\text{máx}} = \mathbf{20.230\text{kg}}$

$\therefore E_{\text{máx}} - W_{\text{total}} = 20.230 - 7.525 = \mathbf{12.706 \text{ kg}}$

With a payload of 6.000 kg , we will have 6.706 kg for fuel and accessories.

Relationship between weight and thrust = $7.525/20.230 = \mathbf{0,37}$
